INFLUENZA VACCINE ADVERSE REACTIONS

Because influenza vaccine contains only non-infectious purified viral proteins, it cannot cause influenza. An occasional case of respiratory disease following immunization represents coincidental illnesses unrelated to influenza immunization.

Mild Problems: Soreness, redness, or swelling where the shot was given. Hoarseness; sore, red or itchy eyes; cough, fever, aches, headache, itching, and fatigue. If these problems occur they usually begin soon after the shot and last 1-2 days.

Severe Problems:

- Life-threatening allergic reactions from vaccines are very rare. If they do occur, it is usually within a few minutes to a few hours after the shot.
- In 1976, a type of inactivated influenza (swine flu) vaccine was associated with Guillain-Barré Syndrome (GBS). Since then, flu vaccines have not been clearly linked to GBS. However, if there is a risk of GBS from current flu vaccines, it would be no more than 1 or 2 cases per million people vaccinated. This is much lower than the risk of severe influenza, which can be prevented by vaccination.

The safety of vaccines is always being monitored. For more information, visit:
